

# Natural Resources Research Center | Montana Tech

**Montana Tech** needs additional laboratory classroom space. The proposed Natural Resources Research Center would either provide an addition to the existing Engineering Lab Classroom Building or become a stand-alone facility. It would include support areas such as office, laboratory, classroom, bathroom and mechanical spaces. The project aims to support Montana Tech natural resource, engineering and energy-related programs.

**The additional space will be used for undergraduate- and graduate-level instruction and research. The new space will provide the facilities for growth in natural resource, engineering and energy-related programs. It will support the campus in educating and providing research opportunities for students in fields that have significant impact on the economic growth in the state.**

The project would bring an additional 35,000 square feet of space to Montana Tech. The facility also will incorporate state-of-the-art technology with infrastructure that can use new tools as they become available. It also would add much-needed classroom space to the campus, as student enrollment continues to outpace available space.

**The project would go on this side of the Engineering Lab Classroom Building.**
